To: Quanata, LLC - Engineering / Talent (Senior Back End Engineer, Remote US)

Subject: Application - Senior Back End Engineer [Remote-US]

Dear Hiring Manager,

I am writing to apply for the **Senior Back End Engineer** role at **Quanata**. The posting lines up with how I have spent the last several years: **owning APIs and integrations**, keeping **relational data** honest under load, and shipping work that other teams depend on in production-not prototypes that stall at the gateway.

At Bath & Body Works I worked across **headless commerce**, **SAP**, **Salesforce Marketing Cloud**, and analytics pipelines, with a steady focus on **contracts, retries, and operational correctness** on paths that touch checkout, authentication, and fraud-adjacent flows. I am comfortable in **Python** and **JavaScript/Node**, have delivered with **Golang** where the team standardized on it, and I lean on **Postgres** and **SQL Server** when the schema is part of the product. Cloud-wise I have shipped on **AWS** and **Azure** and treat **CI/CD**, testing, and observability as part of the feature, not an afterthought. I have also **mentored** engineers and led cross-functional programs-for example directing the nationwide **BOPIS** rollout across **114** stores-so I understand the balance between deep technical work and keeping stakeholders aligned when timelines slip.

Quanata's mission-**context-based insurance** backed by serious infrastructure-appeals to me because it is the same class of problem I know from retail at scale: regulated-feeling data, many moving parts, and zero tolerance for silent failure. I will be direct: I have not spent a career inside **underwriting** systems, but I ramp quickly when paired with strong domain owners, and I already care about the **security and reliability** habits your posting emphasizes.

Separately, I spent roughly **five years** trading and **teaching** others to read market structure-patterns, lessons, and written guides with real depth on **crypto**, **ETFs**, **margin and leverage**, **options**, **futures**, **VIX** and **inverse** products, **candlesticks**, and **indicators**. I then ran my own **investing education business** for about **three to four years** as **CEO**, focused on content and learning. During that time I **coded my own indicator on TradingView (Pine Script)**, used it in **live portfolio** trading, and **sold** it as a **commercial** product for other traders. I mention this because your backend work sits next to **financial and underwriting** systems: I am used to reasoning about **instruments, risk, and correctness** even when the surface is APIs and data pipelines, not charts.

I am **remote US**-based and can work within **core Pacific collaboration hours** as listed. I would welcome a conversation about how **Go** shows up day to day on your team so we can align expectations honestly-I am eager to go deeper on idiomatic **Go** services where that is the standard.

Thank you for considering my application. A tailored CV for this role is available with my materials.

Sincerely,

Terry J. Mork
